BUSINESS PLAN

EduNeuro

EduNeuro

AI-Native Study Orchestration and Learning Platform

Submission to IIT Guwahati Technology Incubation Centre (TIC)

Founder: Sumanta

Entity: EduNeuro

Stage: Open Beta / Pre-Incubation

Document Date: September 2026

Classification: Confidential

This document is submitted in connection with EduNeuro's application for incubation support at IIT Guwahati Technology Incubation Centre. All information contained herein is confidential and intended solely for evaluating the venture.

Table of Contents

1. Executive Summary

EduNeuro is developing an AI-native study orchestration platform designed to address a systemic gap in education technology: the fragmentation of a student's learning journey across disconnected tools that do not share a persistent understanding of the learner.

The platform's core thesis is that the fundamental problem for students is not a lack of educational content, but the absence of an intelligent system that continuously models each learner's state — their goals, knowledge, gaps, study behaviour, and progress — and uses this understanding to recommend the most valuable next learning action.

The initial market wedge is the Graduate Aptitude Test in Engineering (GATE), chosen as a proving ground where the target audience is large, preparation behaviours are well-structured, and the stakes create strong motivation to adopt tools that genuinely improve efficiency.

EduNeuro is currently in an open-beta phase. Early validation signals — website engagement, organic content reach, and user sign-ups — suggest the core idea resonates with the target audience. The platform has zero paying users, no external funding has been raised, and product-market fit has not been claimed. Monetisation is planned through a freemium/subscription model, with pricing to be validated during the beta phase.

EduNeuro is applying to IIT Guwahati TIC for incubation support to access mentorship, refine product-market strategy, engage with the research and startup ecosystem, and prepare for structured fundraising.

2. Company Overview

Entity: EduNeuro
Founder: Sumanta
Founder Background: Student researcher with a focus on Artificial Intelligence. The founding team currently consists of the founder as the primary operator. No external team members have been formally onboarded.
Current Stage: Open Beta / Pre-Incubation

EduNeuro was founded with the objective of applying AI-driven systems thinking to a genuinely unmet problem in education technology: the fragmentation of the student's learning journey across disconnected tools, and the resulting inability of any single system to understand the learner well enough to provide genuinely personalised guidance.

3. Vision and Mission

Vision

To build an intelligent learning system that understands an individual learner's goals, knowledge state, behaviour, constraints, and progress, and continuously adapts the learning process around them. Over time, EduNeuro aims to become the foundational student intelligence layer that makes personalised, effective learning accessible at scale.

Mission

EduNeuro's mission is to create a unified, AI-native study orchestration platform that replaces the student's fragmented toolchain with a single system that learns from their behaviour and guides their preparation more effectively. The platform begins with the GATE examination as its initial validating wedge and will expand to other competitive examinations and broader learning contexts as the core technology matures.

4. Problem Statement

Students preparing for competitive examinations and managing academic learning routinely operate across five or more disconnected digital tools: video platforms for concept learning, question banks for practice, study planners, productivity and focus apps, and general-purpose AI assistants. None of these tools share information about the student.

The consequence is a set of systemic problems:

- The student knows what they studied but cannot confidently determine what they should study next based on their current mastery level.
- Weak areas deserving targeted attention are not automatically surfaced; the student must identify them manually.
- There is no reliable way to know whether study effort is translating into measurable improvement over time.
- The relationship between study behaviour and outcomes is invisible to the tools being used.
- Revision scheduling is typically manual or based on crude heuristics rather than the student's actual forgetting curve.
- The effectiveness of a study plan cannot be evaluated without manual tracking and analysis that most students do not perform.

EduNeuro's thesis is that the problem is not merely a lack of educational content. It is the absence of an intelligent, longitudinal system that continuously models the student's learning state and orchestrates the next best action across the full preparation journey.

5. Market Opportunity

The addressable opportunity for EduNeuro spans multiple interconnected segments of the education technology market in India, each characterised by large student populations, competitive selection pressure, and growing willingness to invest in preparation tools. **EduNeuro's initial focus is exclusively on the GATE segment.** The other segments listed below represent longer-term expansion opportunities contingent on successful validation in the initial wedge.

Segment	Description	Registrations (India, approx.)
GATE	Graduate Aptitude Test in Engineering — initial wedge	1M+ annually
JEE Main / Advanced	Undergraduate engineering entrance examinations	1M+ annually
NEET	Medical entrance examination	2M+ annually
UPSC CSE	Civil Services Examination	1M+ annually

Segment	Description	Registrations (India, approx.)
CAT / XAT	MBA entrance examinations	300,000+ annually
University Students	Self-directed learners across disciplines	40M+ in higher ed.
Co-Curricular / Extracurricular	Music, fitness, skill development, and structured self-improvement	Large addressable but undefined

Registration figures are publicly available contextual estimates only. EduNeuro does not claim to serve any segment beyond GATE at this stage.

6. Target Customers

The primary target customer is the GATE aspirant in India — typically a final-year undergraduate or working professional aged 21–26 with 1–2 years of preparation experience.

Profile:

- Demographics: Engineering graduates, predominantly male, aged 21–26.
- Behaviour: Self-directed learners who supplement coaching with digital tools. High digital fluency. Increasingly comfortable with AI-augmented platforms.
- Pain points: Aware that their current toolchain is fragmented but uncertain how to optimise it. Frequently struggle with prioritisation, revision, and focus.
- Motivation: GATE scores determine admission to premier M.Tech programmes, PSU recruitment, and research positions, creating strong willingness to adopt tools that genuinely improve preparation efficiency.

Secondary segments (not currently targeted): JEE, NEET, UPSC, CAT aspirants, university students, and co-curricular/extracurricular domains (music, fitness, skill development). These will be evaluated for entry only after validated product-market fit in GATE.

7. Proposed Solution

EduNeuro proposes a unified, AI-native study orchestration platform that continuously understands the learner and determines the most useful next action across the full preparation journey.

Rather than optimising individual activities (watching videos, solving questions, planning schedules), EduNeuro's approach treats the student's entire learning process as a connected system:

- Learning and tutoring support
- Study planning and scheduling
- Practice and assessment
- Adaptive evaluation
- Focus and productivity support
- Progress tracking and analytics
- Personalised recommendations

The system models the learner's state across multiple dimensions — goal, syllabus state, topic mastery, performance, study behaviour, focus, schedule adherence, and intervention effectiveness — and uses this model to generate contextually appropriate next actions. The architecture is designed to become more useful over time as it accumulates longitudinal learner data, creating a compounding personalisation effect.

8. Product Description

EduNeuro is a web-based platform currently in open beta. The table below distinguishes between what is available today and what is under development.

Capability Area	Current Status	Description
AI Learning Support	In development	Concept explanation and tutoring assistance for GATE subjects
Study Planning	In development	Adaptive schedule generation based on exam timeline and learner state
Practice Engine	In development	Curated question practice with difficulty adaptation
Assessment	In development	Topic-wise and full-length test simulation with analytics
Progress Analytics	In development	Longitudinal tracking of mastery, velocity, and behaviour
Focus Tools	Planned	Session-level focus tracking and distraction management
Personalised Recommendations	Planned	AI-driven next-action suggestions based on learner model
Community Features	Planned	Peer comparison and study group functionality

Status reflects the open-beta state as of September 2026. 'In development' indicates active build progress. 'Planned' indicates features scheduled for the incubation period.

9. Technology and AI Architecture

EduNeuro's architecture is built around three foundational principles:

- **Learner State Modelling:** A persistent, multi-dimensional model of each learner's knowledge, behaviour, and progress that grows more accurate with use.
- **Orchestration Engine:** A decision system that uses the learner model to determine the most valuable next action — whether that is learning a concept, practising a topic, revising material, or adjusting the study plan.
- **Longitudinal Data Accumulation:** The architecture is designed to improve as more data about each learner is collected, creating a compounding personalisation effect.

The platform is built on a modern web technology stack. AI components leverage large language models for content generation and reasoning, supplemented by custom algorithms for mastery tracking, spaced-repetition scheduling, and behavioural analytics. The architecture is being designed to support reresponsible AI deployment, including content quality assurance and learner data governance.

Key technical considerations being addressed include: scalable AI inference, real-time learner state updates, evaluation of AI-generated educational content, privacy-preserving data handling, and the design of evaluation frameworks to measure learning-outcome improvement attributable to the platform.

10. Competitive Landscape

The competitive landscape can be understood across four broad categories. No single competitor currently addresses the full orchestration thesis EduNeuro is pursuing.

- **Traditional Coaching Platforms:** Players such as Unacademy, BYJU'S, and others primarily deliver structured video courses and live classes. Their strength is content depth and brand recognition. They do not model individual learner state longitudinally or orchestrate personalised next actions.
- **Question Banks and Practice Platforms:** Tools such as Gradeup and Testbook focus on practice and assessment. They provide performance analytics but do not extend into study planning, focus support, or longitudinal learner modelling.
- **AI Tutors and Chatbots:** Emerging AI-powered tools such as Khanmigo and various ChatGPT-based tutoring wrappers offer conversational learning support. They are reactive rather than proactive — they respond to student queries rather than anticipating the student's needs.
- **Productivity and Study-Planning Apps:** Tools such as Notion, Todoist, and Forest help students manage time and focus but lack educational intelligence — they do not understand what the student is learning or how well.

EduNeuro's intended differentiation lies in the system-level integration of these capabilities around a longitudinal learner model, rather than optimising any single activity in isolation.

11. Competitive Advantage

- **System-Level Architecture:** EduNeuro is designed from the ground up as an integrated system. The learner state model acts as the connective tissue across all capabilities.
- **Longitudinal Learner Intelligence:** As the platform accumulates data, its recommendations improve. This flywheel effect is the intended long-term defensibility mechanism (not yet realised at scale).
- **Exam-First Focus:** Concentrating deeply on GATE before expanding enables domain-specific learning intelligence that generalist tools cannot replicate.
- **AI-Native from Inception:** Unlike legacy platforms adding AI as an afterthought, EduNeuro's architecture is built around AI-driven orchestration.
- **Research-Led Development:** The founder's research orientation enables rigorous experimentation with learning science models and AI techniques.

12. Market Entry Strategy

EduNeuro's market entry follows a wedge-and-expand model:

Phase	Timeline	Focus
Phase 1: GATE Be	Current – Month 6	Establish product-market fit with GATE aspirants through open beta. Build core syllabu
Phase 2: Beta Dee	Months 6–12	Complete learning loop: practice engine, assessment, analytics, focus tools. Iterate ba
Phase 3: Monetisa	Months 10–15	Activate paid tier. Validate pricing and conversion. Strengthen retention and personalis
Phase 4: GATE Sc	Months 15–24	Multi-branch GATE support (CS, EC, EE, ME, CE, IN). Community features. Institution
Phase 5: Expansio	Month 24+	Assess expansion to JEE, NEET, UPSC, CAT, and co-curricular domains (music, fitne

Expansion into segments beyond GATE will only proceed after validated product-market fit in the initial wedge.

13. Business Model

EduNeuro's business model follows a software/platform approach:

- **Freemium Tier:** A free tier providing core study planning, basic practice, and limited AI support. This tier drives acquisition and allows students to experience the platform's value.
- **Premium Subscription:** A paid tier providing full access to advanced AI tutoring, comprehensive analytics, personalised recommendations, focus tools, and priority support. Initial monetisation is planned through a freemium/subscription model, with pricing to be validated during the early beta phase.

Current monetisation status: EduNeuro has zero paying users. The platform is in open beta and monetisation features have not been activated.

Alternative or supplementary revenue streams — including institutional partnerships, B2B offerings, and curated content licensing — may be explored in the future but are not part of the current plan.

14. Marketing and User Acquisition

- **Content Marketing:** Publishing educational content — study strategies, syllabus analysis, preparation tips — on platforms where GATE aspirants are active. Early organic reach of 200,000+ demonstrates the viability of this channel.
- **Community Engagement:** Building trust within GATE preparation communities through genuine value contribution rather than promotional activity.
- **Product-Led Virality:** Designing for organic sharing — study plan exports, performance summaries — that naturally expose the platform to new users.
- **Institutional Outreach:** In later stages, engaging coaching institutions and engineering colleges for structured adoption.

Paid advertising is not part of the current strategy and will be evaluated only after organic channels are validated at scale.

15. Current Validation and Traction

EduNeuro is in an early open-beta phase. The following signals represent early-stage validation from different measurement periods and definitions. They should be interpreted as directional indicators rather than evidence of product-market fit. Figures should not be combined into a single traction metric.

Current Product Validation

- Current DAU: 50+ (recent measurement)
- User sign-ups / expressions of interest: 500+
- Peak observed daily users: approximately 400 (during an early launch period)

Website and Content Engagement

- 505 website visitors (cumulative, early beta period)
- 3,093 page views (cumulative, early beta period)
- 126 platform responses (cumulative, early beta period)

- 200,000+ organic content reach (social media impressions)
- 150,000+ organic content views (engagement views)
- 2.6 lakh+ Instagram content views (organic)

Period-Specific Observations

- 2,565 page views recorded over a specific 6-day observation period, with approximately 400 daily users during that period.
- 3,000+ users and 4,000+ website views recorded over a specific 8-day period.

Note: *Figures marked with (+) come from different measurement periods and definitions and are presented as early validation signals only. They should not be combined into a single traction metric. EduNeuro has zero paying users and has not claimed product-market fit.*

User research has been conducted through surveys administered alongside content distribution, providing qualitative insights into user needs, pain points, and feature preferences.

16. Product Development Roadmap

Phase	Timeline	Priorities
1. Beta Foundatio	Months 1–3	Core GATE syllabus mapping, AI tutoring MVP, learner model foundations, basic stud
2. Beta Expansion	Months 4–6	Practice engine, assessment modules, progress analytics, user research iteration and
3. Beta Maturation	Months 7–9	Personalised recommendations, longitudinal learner model, focus tools, freemium infra
4. Launch Readine	Months 10–12	Full feature suite, paid tier activation, community features, institutional outreach prepa
5. Scale Preparatio	Months 12–18	Multi-branch GATE support, infrastructure scaling, expansion-market evaluation

Timelines are indicative and will be refined during incubation based on progress, user feedback, and mentor input. Future phases are targets, not commitments.

17. Operations

- **Development:** The platform is being developed using modern web technologies with AI components integrated through API-based and custom model approaches. Development is ongoing with iterative releases.
- **Hosting:** Cloud-based hosting with auto-scaling planned for growth phases. Performance and reliability are priority considerations.
- **Content:** GATE syllabus content, question sets, and study materials are being curated during product development. Content quality assurance processes are being established.
- **User Support:** Currently handled directly by the founder. Structured support channels will be established as the user base grows.
- **Team:** The current team consists of the founder as the primary operator. Planned expansion includes technical capability, content development resources, and community management — contingent on incubation progress.

18. Risk Analysis and Mitigation

Risk	Impact	Likelihood	Mitigation Approach
No product-market f	High	Medium	Continuous user research, rapid iteration, beta-user engagement, mentor-gui
AI content quality	High	Medium	Content validation pipelines, human review, evaluation frameworks
Long development c	Medium	Medium	MVP-first approach, phased feature releases, incubation accountability
Competitive pressur	Medium	High	Deep domain focus (GATE), system-level differentiation, community trust
User acquisition cos	Medium	Medium	Content-driven organic growth as primary channel; paid only after organic val
Data privacy concer	High	Medium	Privacy-by-design architecture, transparent data policies, compliance-first app
Team scaling	Medium	High	Incubation network access, structured hiring plan post-admission

19. Social and Educational Impact

- Democratising access to AI-powered personalised learning for students who cannot afford expensive one-on-one coaching.
- Reducing the cognitive load of deciding what to study next — a meta-cognitive task that currently consumes significant mental energy without adding to learning.
- Making quality preparation support accessible in Tier-2 and Tier-3 cities where premium coaching infrastructure is limited.
- Contributing to educational research through reresponsible deployment and transparent evaluation of learning outcomes.

20. Financial Strategy

EduNeuro is pre-revenue and pre-funding. Financial management at this phase focuses on minimising burn while maximising development velocity and validation proceed.

- **Current expenditure:** Minimal. Primary costs are cloud infrastructure, AI API usage, and essential development tools.
- **Revenue:** None. No monetisation features are currently active.
- **External funding:** None raised to date.
- **Post-incubation planning:** A detailed financial model will be developed during incubation with mentor guidance, covering an 18–24 month runway, subscription unit economics, and fundraising milestones.
- **Projected revenue:** Not projected at this stage. Revenue targets will be established during incubation based on validated pricing and conversion assumptions.

21. Incubation and Funding Requirements

EduNeuro is seeking incubation support from IIT Guwahati TIC to accelerate development and increase the probability of successful product-market validation.

- **Incubation duration:** 12–18 months (preferred)
- **Physical workspace:** Co-working space at IIT Guwahati TIC
- **Mentorship:** Access to mentors in AI/ML, educational technology, product management, and startup operations (detailed in the accompanying Mentorship Form)

- **Seed funding:** Pre-seed funding, details to be discussed with TIC.
- **Technical resources:** Computing infrastructure, research collaboration opportunities, and potential student researcher engagement
- **Network access:** Introductions to investors, industry partners, and the startup ecosystem
- **Post-incubation fundraising:** Planning for a pre-seed/seed round following incubation, contingent on achieving defined milestones. Details to be developed during incubation.

22. Milestones

Milestone	Target Timeline	Status
Open beta launch	Completed	Achieved
500+ user sign-ups	Completed	Achieved
50+ DAU	Completed	Achieved
IIT Guwahati TIC incubation admission	Q4 2026	Planned
Complete feature beta	Month 6	Planned
Paid tier activation	Month 10–12	Planned
1,000 paying users	Month 18	Planned target
Pre-seed fundraising	Month 12–15	Planned

Future milestones are projections based on current trajectory and will be refined during incubation. Achieving them depends on product-market validation, team capacity, and incubation support.

23. Conclusion

EduNeuro represents a focused, technically ambitious attempt to address a genuinely underserved problem: the fragmentation of the student's learning journey and the absence of any system that understands and guides the learner as an individual.

The venture is at an early but promising stage. The founder brings a research background in AI and a clear technical vision. Early validation signals — including website engagement, content reach, and user sign-ups — suggest the core idea resonates with the target audience. Product-market fit has not been achieved, the platform has zero paying users, and no external funding has been raised.

The GATE market was selected deliberately as the proving ground. It offers a large, motivated, digitally literate user base with well-defined preparation needs and clear success metrics.

EduNeuro is seeking IIT Guwahati TIC's incubation support to access mentorship, technical resources, ecosystem connections, and structured accountability. The combination of the founder's technical orientation, the institution's educational mission, and TIC's startup support infrastructure creates a well-matched partnership opportunity.

We welcome the opportunity to discuss EduNeuro's development plan in greater detail.
